Bloom, Harvesting and Marketing Dates, and  
Principal Producing Counties by States X

This handbook is the first to present usual bloom, harvesting, and marketing dates and principal producing counties for all of the fruits and tree nuts covered in the national program of crop reports. Before, the only publications of this nature on a national basis, issued by the Crop Reporting Board, were separate bulletins for apples, peaches, pears, and cherries. Several of these earlier bulletins, published during the period 1947-54, are now out of print.

The State Statisticians of the Agricultural Estimates Division compiled the basic information, prepared the estimates of usual dates, and designated the important areas of production for their respective States, shown in this handbook.

## DEFINITIONS

The key terms used are defined as follows:

Usual Dates - All of the dates--bloom, harvesting, and marketing--are designated as "usual" dates. In other words, the dates are intended to cover most seasons, but do exclude exceptionally early or exceptionally late seasons.

Full Bloom - In most instances a period of time is shown for full bloom. This represents the period when most, but not all, of the orchards in the specified area usually come into full bloom. In a few instances a single date has been shown. This represents the average peak date of full bloom for most orchards in that area.

Harvesting Dates - The beginning and ending dates encompass the period in which the fruit is usually picked.

Marketing Dates - In general, the beginning and ending dates for marketing cover the period in which the fruit is usually marketed by the growers in the specified area. The marketing dates do not represent the period in which processed products, such as canned or frozen fruits, move into marketing channels. For storage crops, such as apples, the marketing period covers growers' sales from storage. For the more perishable crops there may be virtually no lag between harvesting and marketing.

2  
Prepared by Reginald Royston, Irvin Holmes, and Earl L. Park, Fruit and Vegetable Statistics Branch, Agricultural Estimates Division. Primary data were provided by State Statisticians' offices.

Most Active Harvesting and Marketing Dates - These dates cover the periods when the bulk of the harvesting and the bulk of the marketing usually occur. They do not include the usual periods of light harvesting and marketing at the beginning and end of each season.

Average Production - These 10-year average production data have been included, where available, to indicate the relative importance of each State. In a few instances, covered by footnotes, new areas of production have been included for which 10-year average production data are not yet available.

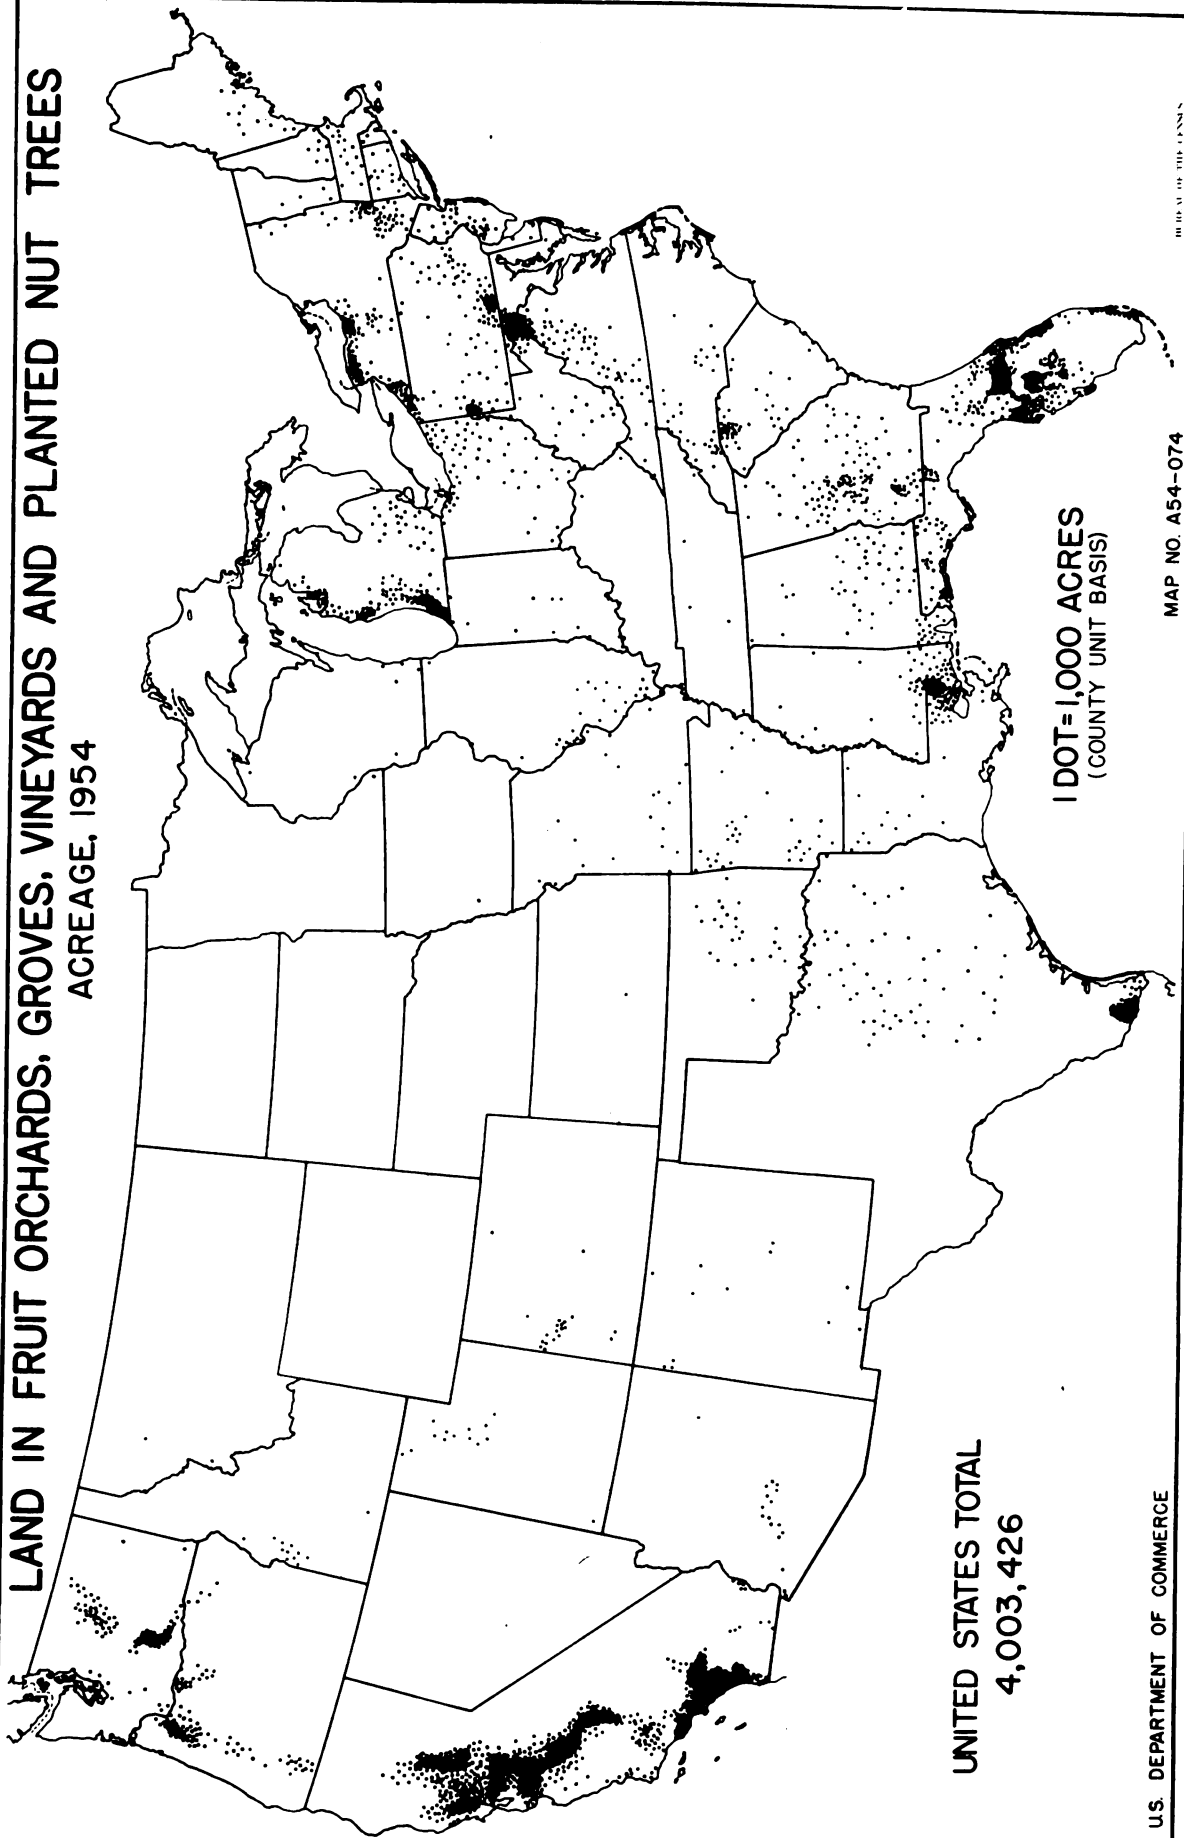

Principal Producing Counties - The principal producing counties are listed in order of importance within each area. Order of importance was based on the number of trees of bearing age shown in the last U. S. Census, or upon more recent data, if available. The actual producing section may, of course, cover only a part of a county. It should not be assumed that all counties listed are necessarily commercially important. The counties shown have been selected purely from the standpoint of their relative importance in their State. In some instances, the bulk of the production in a county may be from farm orchards, with very little grown for sale. Pears in the southern States are a good example of this.

Area and Varietal Breakdowns Within States - Area breakdowns within States have been shown where such information is available. Areas are arranged in order of importance, which was determined in the same manner as described for the principal producing counties. Separate tabulations of available data are shown for each of the apple varieties covered in the national apple variety report. For the other fruits any variety information available has been included in the regular tabulation by States.

Comparison of State and Within-State Dates - In most instances the beginning and ending dates of full bloom, harvesting and marketing, given for a State, represent simply the range in dates reported for the area and/or varietal groups shown for that State. In a few instances, these beginning and ending State dates allow for areas or varieties which were not important enough to show separately in this handbook. For the most active harvesting and marketing dates, however, the minor areas or varieties carried little weight in determining State figures.
